

EMI Troubleshooting & Pre-Compliance Equipment List

Kenneth Wyatt, Wyatt Technical Services LLC
ken@emc-seminars.com

I find the following equipment useful for troubleshooting EMI issues and performing pre-compliance testing. Note that this is not an exhaustive list, as there are many other quality suppliers of EMC test equipment. Please click the links of any recommended manufacturers on this page: <http://www.emc-seminars.com/Manufacturers/Manufacturers.html> to explore other options.

CISPR 11 (Radiated & Conducted Emissions)

- Calibrated EMI antenna (30 to 1000 MHz, min.) Consider the BicoLOG 30100 or 30100X (includes integral broadband preamp) antenna from Aaronia.
- Affordable, compact, troubleshooting antennas (limited calibration) based on PC board designs are available from Kent Electronics.
- Non-metallic tripod that can hold the antenna at 1m height.
- Basic spectrum analyzer (Rigol DSA800-series or Siglent SSA 3000X-series that covers up to at least 1 GHz).
- For more advanced signal analysis, including capture and measurement of wireless signals up to 6.2 GHz, consider the real-time Tektronix RSA306B or Signal Hound BB60C USB-powered modular real-time analyzer, or other lab-grade bench top analyzers from Keysight Technologies, Rohde & Schwarz, or Tektronix.
- Non-metallic table for EUT (could be manual turntable or even a roll-around cart).
- Ideally a ground plane, but most pre-compliance setups just use the floor.
- Line Impedance Stabilization Network (LISN) for conducted emissions. These come in DC or AC models. Consider the models from TekBox Technologies.

IEC/EN 61000-4-2 (ESD)

- ESD simulator (could be a used KeyTek MiniZap, or equiv.). New units are available from many manufacturers, such as EMC-Partner, EM Test, Haefley, Noiseken, Teseq, and Thermo Keytek.
- ESD test table. Construct according to the IEC 61000-4-2 standard. Will require a ground plane.

IEC/EN 61000-4-3 (Radiated Immunity)

- RF generator with a minimum of +10 to +20 dBm output, at 80 to 2700 MHz, capable of 1 kHz 80% AM modulation. Use with near field probes to inject a signal. Modular USB-controlled RF generators are available from Signal Hound, TPI, and Windfreak Technologies. Bench top RF generators are available from Keysight Technologies, Rohde & Schwarz, Siglent Technologies, and Rigol Technologies. See also references 4 and 5 for details on testing.
- OR Use a TEM cell (check out the "open" cells by Tekbox Technologies. See reference 6.
- OR Use a common Family Radio Service (FRS) two-way radio for a gross check at 465 MHz.

IEC/EN 61000-4-4 (Electrically Fast Transient - EFT)

- EFT generator is best.

- OR Use a KeyTek MiniZap ESD simulator (or equivalent), inductively coupled to the power cord and set to 20 pps. See reference 4.

IEC/EN 61000-4-5 (Power Line Surge)

- Surge tester. There is no cheap workaround for this. Best to rent as needed.

IEC/EN 61000-4-6 (Conducted Immunity)

- RF generator (150 kHz to 80 MHz, 3Vrms, 80% modulation).
- Will probably need a 10W (or more) broadband power amplifier that covers these frequencies.
- Various injection clamps for the line cord and coupling networks for Ethernet (cables shorter than 3m are not tested). See Reference 8 for alternative test methods.

IEC/EN 61000-4-11 (Power Line Dips, Brownouts)

- Power line tester. There is no cheap workaround for this. Best to rent as needed.

Miscellaneous Equipment

- Current probe (Fischer Custom Communications F-33-1, or equivalent). Current probes are also available from Pearson Electronics and Rigol Technologies.
- Near field probe set (Check out Beehive Electronics, Tekbox Technologies, Siglent, or Rigol).
- My book, EMI Troubleshooting Cookbook for Product Designers, covers a lot of pre-compliance testing that can be performed in-house. See reference 8 below.
